

ADRA

Anti-theft doors and wooden construction doors

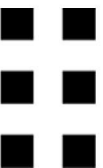

Products :

Types of Anti-theft doors in terms of Body Material :

Wooden Anti-theft Doors

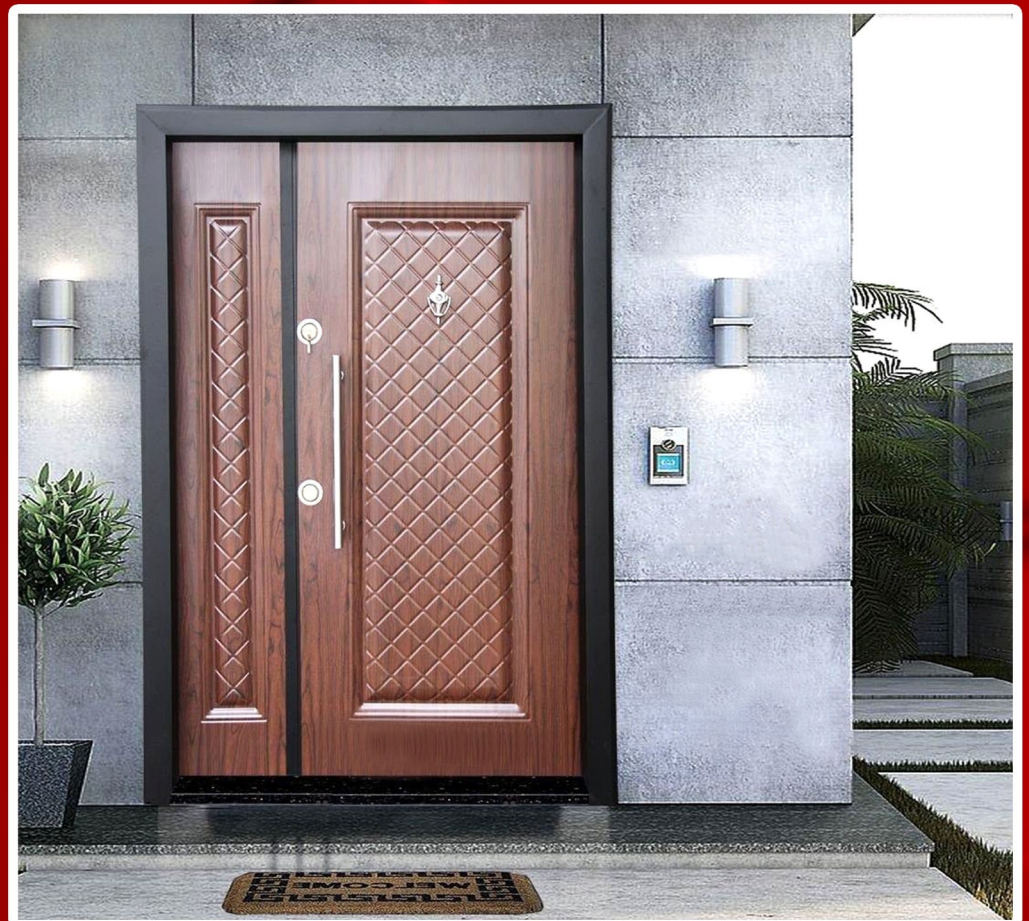

The central or inner part of these doors are made of beech wood, walnut wood, poplar wood, cherry wood and other strong and dense woods. Because the wood structure is not very strong and its fire resistance is low, one or two steel sheets are usually used in wooden doors as a support.

Although, the weight of wood is light, the presence of steel sheets increases their weight and strong fasteners should be used to maintain them.

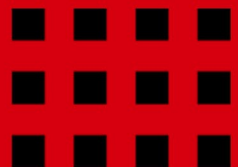

Metal Anti-theft Doors

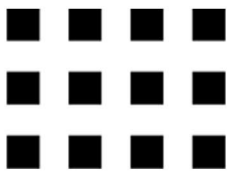

The body of Adra metal doors is made of stainless steel. The presence of metal coating makes them very resistant to scratches and fire and is a good choice for bathrooms, bedrooms and some rooms of factories and companies.

Composite Anti-theft doors

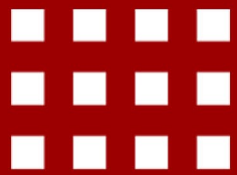

On the other hand, composite anti-theft door is one of the most diverse form of these products in the world. Unlike wood or metal, composite coatings are easily formed and can be used to implement various designs and patterns. This coating has a high resistance to moisture and very light in weight and they can be easily repaired. The inner parts of the composite doors are covered with steel sheet, which has a much higher impact resistance than other options. This cover is a good choice for entrance doors of apartments, bedrooms and small offices and is insulated against moisture and sound

HDF Anti-theft Doors

These doors are made of pressed fiberboard. This cover has a very high density and is used as a cover for cabinets and cupboards. HDF anti-theft doors are very similar to wooden doors and their surface is almost the same. These doors do not have the variety like composite doors, but using the CNC machine, different patterns can be implemented on them, so they are suitable options for entrance doors of houses and offices or doctors' offices.

PVC Anti-theft Doors

Adra PVC anti-theft door is known as one of the modern options in the market. The product has various designs that are easily matched to the taste of every consumer. These doors are highly resistant to moisture and can be used for the entrance door of the building.
